

HackOn with Amazon Season 6.0

#AmazonHackathon

HackOn with Amazon - Season 6.0

48hr Hackathon Challenge

Please find below the 4 themes for this season:

Theme	Problem Statement
Context-Aware Smart Home for Indian Households	Indian homes have unique rhythms — morning pooja, pressure cooker schedules, water motor timings, power cuts, tuition hours, evening chai. Today's smart devices still need explicit commands. Build an AI system using Bedrock that understands household context and anticipates actions — not just responds to them. Students can approach via sensor fusion, routine learning, or conversational AI.
Amazon Now – Reimagining Urgent Shopping	Quick-commerce customers are fundamentally different from traditional e-commerce customers. They often arrive with an immediate need and expect to complete their purchase within seconds, yet today's shopping experiences still rely heavily on search, browsing, and manual decision-making. How might we help customers discover, decide, and purchase what they need in the fastest and most effortless way possible?
Second Life Commerce: AI-Powered Returns & Sustainable Resale	Millions of products bought online are returned, underused, or discarded despite being perfectly usable. Returns are expensive for customers, sellers, and the planet. Customers also struggle to trust refurbished or second-hand products. What if Amazon could create an intelligent ecosystem where returned or unused products automatically find their next best owner? Imagine: - AI deciding whether an item should be resold, refurbished, donated, recycled, or exchanged - Smart quality grading through image/video analysis - Personalized recommendations for certified refurbished products - Sustainable incentives and “green credits” for customers - Easy peer-to-peer resale inside Amazon’s trusted ecosystem - Predictive return prevention before a purchase is even made Build the future of sustainable commerce where every product gets a meaningful second life.

HackOn with Amazon - Season 6.0

AI for Campus, Community & Everyday Life	CampusFlow – AI Operating System for Student Life Student life runs on chaos — class schedules, assignment deadlines, club events, attendance, transport, hostel notices, placement prep, and exam stress are spread across WhatsApp groups, emails, portals, and spreadsheets. Important updates are constantly missed. What if there was a unified AI-powered campus assistant that could understand a student's routine, summarize important updates, organize schedules intelligently, answer campus-related questions instantly, and proactively help students manage everyday academic and personal life? PocketBuddy – AI Financial & Wellness Assistant for Students Many students struggle silently with budgeting, food expenses, emotional stress, irregular sleep, and balancing academics with social life. Existing apps focus on only one aspect — finance, fitness, or productivity — without understanding the realities of student living. What if students had an AI companion that could help manage monthly expenses, recommend affordable food and travel options, detect burnout patterns, encourage healthy routines, and provide personalized support for both financial and emotional well-being throughout college life?
